

Quiz

Let $f, g : A \rightarrow B$ be two arrows. Define the *equalizer* of f and g .

Lemma

Let $X \begin{array}{c} \xrightarrow{f} \\ \xrightarrow{g} \end{array} Y$ be two functions. Then the equalizer of f and g is the set $E := \{x \in X \mid f(x) = g(x)\}$ and the function $e : E \rightarrow X$ defined by $e(w) = w$ - that is, the inclusion.

Proof

First, *Check that $fe = ge$* . Now, let $h : Z \rightarrow X$ be a function such that

$$\begin{array}{ccc} X & \begin{array}{c} \xrightarrow{f} \\ \xrightarrow{g} \end{array} & Y \\ \uparrow h & & \\ Z & & \end{array}$$

commutes. In this case, this is just a different way of saying that $f(h(z)) = g(h(z))$ for every $z \in Z$. This is important, though, because it insures

commutes where ζ is defined by the assignment $z \mapsto h(z)$.
The proof is completed by working the following exercises
and the more general lemma which follows them.

- Prove the first statement in red in the proof above

- Prove the first statement in red in the proof above
- Prove the second statement in red in the proof above. Include in your argument that the definition of ζ makes sense. (What is the issue here?)

Lemma

Let

$$E \xrightarrow{e} A \begin{array}{c} \xrightarrow{f} \\ \xrightarrow{g} \end{array} B$$

be an equalizer diagram. Then e is monic.

Proof

Suppose $e \circ s = e \circ t$ for a pair of arrows s and t from S to E . Then, of course, $f \circ e \circ s = g \circ e \circ s = g \circ e \circ t = f \circ e \circ t$. In other words

$$\begin{array}{ccccc} E & \xrightarrow{e} & A & \begin{array}{c} \xrightarrow{f} \\ \xrightarrow{g} \end{array} & B \\ & & \uparrow & & \\ & & S & & \end{array} \quad \begin{array}{l} \\ \\ \\ eos=eot \end{array}$$

commutes

Since E is an equalizer, there exists a unique map ζ such that

$$\begin{array}{ccccc} E & \xrightarrow{e} & A & \begin{array}{c} \xrightarrow{f} \\ \xrightarrow{g} \end{array} & B \\ & \swarrow \zeta & \uparrow \text{es=et} & & \\ & & S & & \end{array}$$

commutes.

But, both

$$\begin{array}{ccccc} E & \xrightarrow{e} & A & \begin{array}{l} \xrightarrow{f} \\ \xrightarrow{g} \end{array} & B \\ & \swarrow s & \uparrow es=et & & \\ & & S & & \end{array}$$

and

$$\begin{array}{ccccc} E & \xrightarrow{e} & A & \begin{array}{l} \xrightarrow{f} \\ \xrightarrow{g} \end{array} & B \\ & \swarrow t & \uparrow es=et & & \\ & & S & & \end{array}$$

commute. Thus $\zeta = s = t$. Thus, e is monic.

Definition

Let $\{A_i\}_{i \in I}$ be a collection of objects. The *product* of these objects, if it exists, is defined to be an object P and arrows $\{p_i : P \rightarrow A_i\}_{i \in I}$ with the following property: For any object D and arrows $\{d_i : D \rightarrow A_i\}$ there is a unique map ρ so that for every $i \in I$

$$\begin{array}{ccc} D & \xrightarrow{\rho} & P \\ & \searrow d_i & \downarrow p_i \\ & & A_i \end{array}$$

commutes.

In **SET**, as in many, many categories, the product is a relatively familiar construction: It is the set of all I -tuples of elements drawn from the sets. More precisely, we have

Lemma

Let $\{X_i\}_{i \in I}$ be a collection of sets. Then, the product is given by $P := \{(x_i)_{i \in I} \mid x_i \in X_i\}$ and arrows $p_j(x_i)_{i \in I} \mapsto x_j$.

Proof

Let $\{X_i\}$ be a collection of sets. Let Z be a set and $z_i : Z \rightarrow X_i$ a collection of maps, one for each $i \in I$. Define $\rho : Z \rightarrow P$ by $z \mapsto (z_i(z))_{i \in I}$. Then, *clearly*

$$\begin{array}{ccc} Z & \xrightarrow{\rho} & P \\ & \searrow^{z_i} & \downarrow p_i \\ & & X_i \end{array}$$

commutes for each $i \in I$

Now, suppose that γ is a function so that

$$\begin{array}{ccc} Z & \xrightarrow{\gamma} & P \\ & \searrow z_i & \downarrow p_i \\ & & X_i \end{array}$$

commutes. Then, for each $i \in I$, $p_i(\gamma(z)) = z_i(z)$. That is, the i^{th} component of $\gamma(z) = z_i(z)$. This is just the definition of ρ , though. Thus, ρ is unique.
